Referral for Tier 3 Weight Management

Scope

Bariatric surgery services include operations for gastric banding, gastric bypass, sleeve gastrectomy and duodenal switch.

Policy

It is the responsibility of referring and treating clinicians to ensure compliance with this policy. Referral proforma should be attached to the patient notes to aid the clinical audit process and provide evidence of compliance with the policy. Where patients do not fulfil the criteria for referral into Tier 3, clinicians need to apply to the Exceptional Cases Panel by completing the exceptional funding section of the referral proforma. Click policies – select the Weight Management drop down option and select the Referral for Tier 3… Policy to access the referral proforma.

Patients may be referred to Tier 3 weight management if they have:

- BMI >40 kg/m²; or
- BMI >35 kg/m² with other significant disease that could be improved with weight loss (diabetes or hypertension, for example) or
- Are an obese individual with complex needs who has not responded to previous Tier interventions.

Bariatric Surgery is an integral part of the management of severe obesity in selected patients where other forms of weight reduction management have been unsuccessful. Referral to specialist providers of bariatric surgery will be made directly from Tier 3 obesity management services on the recommendations of a specialist multi-disciplinary team (MDT) which includes a Consultant in Obesity Management and after a patient has completed Tier 3 management including physical and psychological assessment and preparation for the surgery.

Bariatric Surgery Assessment

The MDT assessing patients for referral for Bariatric Surgery will ensure that patients fulfil the following criteria:

- BMI >40 kg/m²; or
- BMI >35 kg/m² with other significant disease that could be improved with weight loss;
- AND ALL of the following:
  - age over 18 years old; AND
  - all appropriate non-surgical measures have been tried; AND
  - the person has received and completed intensive management in a specialist (Tier 3) obesity service for 12 months (BMI<50 kg/m²) or 6 months (BMI>50 kg/m²); AND
  - the person has attended ≥80% of required Tier 3 weight management sessions; AND
  - decision for suitability for bariatric surgery has been made after appropriate multi-disciplinary team discussion between the Tier 3 obesity service and Tier 4 surgery service.

For patients in whom bariatric surgery is required without prior weight management at Tier 3 (eg for appropriate cancer intervention), patients should be referred to the Tier 3 obesity service in the first instance and an urgent request for exceptional funding made. Patients who smoke should be referred to the Stop Smoking Service.

**Bariatric Surgery Follow-up Care**
The bariatric surgical provider is responsible for the organisation of structured, systematic and team based follow-up of patients for 2 years post-surgery.

After discharge from bariatric surgery service follow-up, all people should be offered at least annual monitoring of nutritional status and appropriate supplementation according to need in line with recommendations made in NICE clinical guidelines 189. Cosmetic procedures (eg abdominoplasty) to remove any excess skin folds that may result from rapid weight loss should not be routinely funded post bariatric surgery.

Patients treated privately for bariatric surgery will only be eligible for NHS Tier 3 weight management service if they met the criteria for access to Tier 3 services at the time of their bariatric surgery.

**Rationale**

NICE recommend that surgery to aid weight reduction for adults with morbid/severe obesity should be considered (when there is recent and comprehensive evidence that) an individual patient has fully engaged in a structured weight loss programme; and that all appropriate non-invasive measures have been tried continuously and for a sufficient period; but have failed to achieve and maintain a clinically significant weight loss for the patient’s clinical needs (NICE CG43). They recommend that the patient should have been adequately counselled and prepared for bariatric surgery.

The surgical procedures are known to result in significant and sustainable weight loss within 1-2 years, as well as reductions in co-morbidities and mortality.\(^1,2\)

- Commissioning responsibility for bariatric surgery services transferred to the CCG from NHS England on 1 April 2017\(^3\).
- NICE Guidelines CG43 and CG189 (Nov 2014) provide guidance for managing obesity including criteria for progressing treatment to bariatric surgery.
- Only once patients have successfully completed an intensive obesity management (Tier 3 service) can they be referred for bariatric surgery under NICE guidelines.
- A Health Policy Support Unit report (2011) summarising NICE and SIGN guidelines\(^4\) concluded that bariatric surgery is the most effective treatment for morbid obesity, producing durable weight loss, improvements or remission of co-morbid conditions and longer life.
- Bariatric surgery consistently improved weight and diabetic outcomes compared to non-surgery in people with recent onset Type 2 Diabetes (NICE CG 189).
- Life-long follow up will ensure that weight loss outcomes, micronutrient deficiencies and any surgical complications are monitored as well as adherence to iron, vitamin D/Calcium and Vitamin B12 supplementation. Psychological input, management of comorbidities, dietary and lifestyle advice and liaison with general practice will also be necessary as part of the follow up.
