Baby Milks

Summary
- Prescribing costs associated with nutritional products has been increasing.
- Priority areas to review include Specialist Infant Formula.

Aim/Purpose/Background
- Identify patients inappropriately prescribed baby milks.
- Identify patients prescribed baby milks which can be purchased over the counter at prices similar to standard baby milks.
- Review patient notes with a view to stop treatment if inappropriate or change to recommended product.
- This is a cost/quality/ and safety intervention.

Guidance for Action
- Run search: Check patients on baby milk at practices, under action group on SystmOne/ Emis web - foods for special diets and nutritional support (exclude Gluten free products).
- Check patient notes;
  - Are they under the care of a dietician?
  - Are they on a product started by hospital and not been reviewed in the last year?
  - Check repeat and acute prescriptions.
  - Check Quantities prescribed (see below for info).
  - GPs can refer to dietetics team- see referral form.
  - MMT pharmacist/technicians can refer with a letter and form to the dietetics team to review a patient.
  - Review prescribing of infant formula’s including whether patient should be advised to purchase, length of time on specialist infant formula and quantity being prescribed. Inform GP to discontinue at appropriate time (e.g. 1 boy 9 yrs old still on feed).
  - Produce list of patients to refer, to get agreement from GP either they do themselves or produce letter and refer to dietetics.
  - Patients will be contacted by either dietetic team or GP if items stopped (please contact dietitians@nhs.net).
  - Advanced Paediatric Dietitian (01480) 416740 or 07908 181060.

Benefits from doing reviews:
- Reduce spend on Baby Milks.
- Patient nutritional needs assessed by appropriate clinicians.
- Patients receive regular review for continuing need.
- Advice and support for the family.

Quantities of Formula to prescribe
